

UNITED STATES PATENT AND TRADEMARK OFFICE

Examiner:

Group:

Attorney Docket # 1945

Applicant(s) : BLAHAK, A., ET AL

Serial No. :

Filed :

For : ROTATING ELECTRICAL MACHINE

SIMULTANEOUS AMENDMENT

December 10, 2001

Honorable Commissioner of Patents and Trademarks
Washington, D.C. 20231

S I R S:

Simultaneously with filing of the above identified application
please amend the same as follows:

In the Claims:

Cancel all claims without prejudice.

Substitute the claims attached hereto.

REMARKS:

This Amendment is submitted simultaneously with filing of the above identified application.

With the present Amendment applicant has amended the claims so as to eliminate their multiple dependency.

Consideration and allowance of the present application is most respectfully requested.

Michael J. Striker
Attorney for Applicant(s)
Reg. No. 27233

Attorney for Applicant(s)

Reg. No. 27233

Claims

1. A rotating electrical machine with a contacting device whose circumference has at least one slide contact disposed on it, which remains in sliding contact with a brush apparatus (slide system), in which the at least one slide contact is comprised of a wear resistant material, characterized in that the electrical machine has an internal cooling system in which a fluid/gas mixture used as a cooling medium circulates around the components to be cooled, including the slide system, and the at least one slide contact is comprised of an alloy with at least one alloy component that has an affinity for oxygen.

2. The rotating electrical machine according to claim 1, characterized in that a main component of the alloy is copper and the alloy component with the affinity for oxygen is a base metal and/or a metalloid.

3. The rotating electrical machine according to claim 2, characterized in that the base metal is an element or a combination of elements from the group including magnesium, zirconium, titanium, hafnium, tungsten, molybdenum, vanadium, and iron.

4. The rotating electrical machine according to claim 2, characterized in that the metalloid is an element or a combination of elements from the group including tellurium, silicon, and boron.

5. The rotating electrical machine according to [one of the preceding claims] claim 1, characterized in that a weight percentage in the alloy of the alloy components with the affinity for oxygen is in the range from 0.05 to 3%, in particular from 0.3 to 0.9%.

6. The rotating electrical machine according to [one of the preceding claims] claim 1, characterized in that the alloy contains companion elements such as oxygen and/or phosphorus in the parts per thousand or parts per million range.

7. The rotating electrical machine according to [one of the preceding claims]
claim 1, characterized in that the fluid is an oil.

Claims

1. A rotating electrical machine with a contacting device whose circumference has at least one slide contact disposed on it, which remains in sliding contact with a brush apparatus (slide system), in which the at least one slide contact is comprised of a wear resistant material, characterized in that the electrical machine has an internal cooling system in which a fluid/gas mixture used as a cooling medium circulates around the components to be cooled, including the slide system, and the at least one slide contact is comprised of an alloy with at least one alloy component that has an affinity for oxygen.

2. The rotating electrical machine according to claim 1, characterized in that a main component of the alloy is copper and the alloy component with the affinity for oxygen is a base metal and/or a metalloid.

3. The rotating electrical machine according to claim 2, characterized in that the base metal is an element or a combination of elements from the group including magnesium, zirconium, titanium, hafnium, tungsten, molybdenum, vanadium, and iron.

4. The rotating electrical machine according to claim 2, characterized in that the metalloid is an element or a combination of elements from the group including tellurium, silicon, and boron.

5. The rotating electrical machine according to claim 1, characterized in that a weight percentage in the alloy of the alloy components with the affinity for oxygen is in the range from 0.05 to 3%, in particular from 0.3 to 0.9%.

6. The rotating electrical machine according to claim 1, characterized in that the alloy contains companion elements such as oxygen and/or phosphorus in the parts per thousand or parts per million range.
